**INSTITUTE OF GRADUATE STUDIES****DECLARATION OF ORIGINAL WORK**

This declaration is made on the MARCH day of 22 2021

**i. Student's Declaration:**

I, NATASA MOHD SHAKRI, M20191000775 (PLEASE INDICATE STUDENT'S NAME, MATRIC NO. AND FACULTY) hereby declare that the work entitled ANALYSIS OF ESSENTIAL OILS AND PHYTOCHEMICALS FROM SELECTED ANNONACEAE FAMILY AND CYCLOOXYGENASE-2 INHIBITORY ACTIVITY is my original work. I have not copied from any other students' work or from any other sources except where due reference or acknowledgement is made explicitly in the text, nor has any part been written for me by another person.

Signature of the student

**ii. Supervisor's Declaration:**

I DR. WAN MOHD NUZUL HAKIMI W SALLEH (SUPERVISOR'S NAME) hereby certifies that the work entitled ANALYSIS OF ESSENTIAL OILS AND PHYTOCHEMICALS FROM SELECTED ANNONACEAE FAMILY AND CYCLOOXYGENASE-2 INHIBITORY ACTIVITY (TITLE) was prepared by the above named student, and was submitted to the Institute of Graduate Studies as a \* partial/full fulfillment for the conferment of MASTER OF SCIENCE (NATURAL PRODUCTS) (PLEASE INDICATE THE DEGREE), and the aforementioned work, to the best of my knowledge, is the said student's work.

*The memory of my parents, **Mohd Shakri Khatib** and **Sariah Jamil**. Even though you both are no longer here with me, but your love and affection is the reason I am still standing strong here today.*

*To my brother and sister, **Mohammad Shahril Iqmal** and **Shikin Nabilah**, who have been my sources of inspiration and strongest support system.*

*To my close family and friends, who always shared their word of advice and encourage me to complete this study.*

*This humble work is a sign of my love to all of you.*

## ACKNOWLEDGEMENT

First and foremost, Alhamdulillah, praises and thanks to Allah, the Almighty, for his countless blessings, throughout my research work to successfully completed the research.

I would like to express my deep and sincere gratitude to Dr. Wan Mohd Nuzul Hakimi Wan Salleh, my research supervisor, for giving me the opportunity to do this research under his supervision and providing me with valuable guidance and support throughout this research. I was truly inspired by his hard work and passion. It was a great privilege and honor to work and study under his supervision.

I would also like to thank Dr. Nor Azah Mohamad Ali and Mrs. Mailina Jamil from Natural Product Division, Forest Research Institute Malaysia for the services and access for GC and GC-MS instruments. Sincerely thanks to the Department of Chemistry, Faculty of Science and Mathematics, UPSI for the access of laboratory and instruments.

Last but not least, special thanks to my lab mates and friends; Ammar, Basri, Siddiq, Juliana, Suffiya, Maya, Ainol, Farhana, Hajar, Auni, Ida, Nabila, Helena, Auni, Fadriz, Fikri, Izzul, and Ridhwan for their moral support, advice and guidance throughout my research.

## ABSTRACT

The aims of this study were to analyse the essential oils, phytochemistry and cyclooxygenase-2 inhibitory activity of selected species of the genus *Polyalthia* (*P. stenopetalla*, *P. sumatrana*, *P. cauliflora* and *P. rumphii*), *Xylopi*a (*X. magna*, *X. ferruginea* and *X. frutescens*) and *Goniothalamus* (*G. macrophyllus* and *G. malayanus*) from Annonaceae family. The essential oils were obtained via hydrodistillation technique and their chemical compositions were determined by gas chromatography (GC-FID) and gas chromatography-mass spectrometry (GC-MS). The phytochemicals were obtained using chromatography techniques and their structures were confirmed by spectroscopic data and comparison with literatures. The bioactivity of the essential oils and extracts was investigated using cyclooxygenase-2 (COX-2) inhibitory activity. The study showed the essential oils of *P. sumatrana*, *P. stenopetalla*, *P. cauliflora* and *P. rumphii* were made up of bicyclogermacrene (18.8%),  $\alpha$ -cadinol (13.0%),  $\delta$ -elemene (38.1%) and germacrene D (33.3%), respectively. The major components of essential oil from *X. frutescens* was bicyclogermacrene (22.8%), whereas *X. magna* gave germacrene D (35.9%) and *X. ferruginea* was dominated by bicyclogermacrene (23.6%). As for *G. malayanus* and *G. macrophyllus*, the essential oils consisted mainly of bicyclogermacrene (43.9%) and germacrene D (25.1%), respectively. The dichloromethane and methanol leaf extracts of *P. rumphii* yielded seven phytochemicals identified as 5,7-dimethoxyflavone, 4',5,7-trimethoxyflavone, 5-hydroxy-7-methoxyflavone, 4'-hydroxy-5,7-dimethoxyflavone,  $\beta$ -sitosterol, lupeol and taraxerol. The essential oil of *G. macrophyllus* and methanolic extracts of *X. magna* and *X. frutescens* displayed the best results in COX-2 inhibitory activity with percentage of 18.6%, 13.8% and 21.9%, respectively. In conclusion, the composition of the essential oils from nine species of Annonaceae family have shown that sesquiterpene hydrocarbons as their major components, meanwhile phytochemical studies had yielded flavonoids and terpenes compounds. The implication of this study demonstrate the essential oils and extracts of the genus *Xylopi*a and *Goniothalamus* can be useful for rheumatism treatment.

## ANALISIS MINYAK PATI DAN FITOKIMIA DARI KELUARGA ANNONACEAE TERPILIH DAN AKTIVITI PERENCATAN SIKLOOKSIGENASE

### ABSTRAK

Tujuan kajian untuk menganalisis minyak pati, fitokimia dan aktiviti perencatan siklooksigenase-2 bagi tumbuhan terpilih daripada genus *Polyalthia* (*P. stenopetalla*, *P. sumatrana*, *P. cauliflora* dan *P. rumphii*), *Xylopi* (*X. magna*, *X. ferruginea* dan *X. frutescens*) dan *Goniothalamus* (*G. macrophyllus* dan *G. malayanus*) daripada keluarga Annonaceae. Minyak pati diperoleh melalui penyulingan hidro dan kandungan kimianya ditentukan melalui kromatografi gas (GC-FID) dan kromatografi gas-spektrometri jisim (GC-MC). Sebatian fitokimia diperolehi menggunakan teknik kromatografi dan strukturnya disahkan melalui data spektroskopi dan perbandingan dengan data literatur. Bioaktiviti minyak pati dan ekstrak dikaji menggunakan aktiviti perencatan siklooksigenase-2 (COX-2). Kajian menunjukkan minyak pati daripada *P. sumatrana*, *P. stenopetalla*, *P. cauliflora* and *P. rumphii* masing-masing terdiri daripada bisiklogermakren (18.8%),  $\alpha$ -kadinol (13.0%),  $\delta$ -elemen (38.1%) dan germakren D (33.3%). Komponen utama minyak pati daripada *X. frutescens* adalah bisiklogermakren (22.8%), manakala *X. magna* memberikan germakren D (35.9%) dan *X. ferruginea* didominasi oleh bisiklogermakren (23.6%). Bagi *G. malayanus* dan *G. macrophyllus*, minyak pati masing-masing terdiri terutamanya bisiklogermakren (43.9%) dan germakren D (25.1%). Ekstrak diklorometana dan metanol daripada daun *P. rumphii* menghasilkan tujuh sebatian fitokimia yang dikenalpasti sebagai 5,7-dimetoksiflavon, 4',5,7-trimetoksiflavon, 5-hidroksi-7-metoksiflavon, 4'-hidroksi-5,7-dimetoksiflavon,  $\beta$ -sitosterol, lupeol dan taraxerol. Minyak pati *G. macrophyllus* dan ekstrak metanol *X. magna* dan *X. frutescens* menunjukkan hasil terbaik dalam aktiviti perencatan COX-2 dengan peratusan masing-masing 18.6%, 13.8% dan 21.9%. Kesimpulannya, komposisi minyak pati daripada sembilan spesies famili Annonaceae menunjukkan hidrokarbon seskuiterpena adalah komponen utamanya, manakala kajian fitokimia telah menghasilkan sebatian flavon dan terpena. Implikasi kajian ini menunjukkan minyak pati dan ekstrak daripada genus *Xylopi* dan *Goniothalamus* boleh digunakan dalam rawatan reumatisme.

ptbupsi

Nature can be very beneficial to human who can support the basic needs such as source of foods, tools for shelter, and even traditional medicine. Natural products have been the backbone of traditional medicine ever since antiquity. Medicinal plants are great value to mankind. They are the gift of nature to human beings to lead a disease-free and healthy life. They have a crucial role to play in preserving our health (Oladeji, 2016). Although synthetic products or medicines are more popular at the moment due to its affordability of production, time savings and convenient quality control, their safety and effectiveness will always be questionable. As a result, more than 80% of the total population in the developing world depend on natural products because of its time effectiveness and reliability (Veeresham, 2012).

As a source of medicinal agents for the treatment of human diseases, natural products derived from plants have long been, and will continue to be, incredibly important. Mythology records of diverse cultures have provided lists of plants with beneficial medicinal properties (Salleh et al., 2016). However, despite these many important past contributions from the plant kingdom, many species of plants still haven't been characterised and remain undiscovered. In addition, only several plants species have been described for biologically active chemical components. It is therefore reasonable to assume that new plant sources of important and pharmaceutically amusing components would then remain to be discovered (Newman, Cragg & Snader, 2000).

Medicinal uses have been reported and described for a total of 6,000 floral species in the tropical regions. Based on the records, a significant number of 1,230 species were already identified in Malaysia as medicinal plants used in alternative medicine (Zakaria & Mohd, 1994). Alternative medicine is an indispensable part of the Malaysian cultural heritage and has been practiced in the country by different ethnic groups even before modern medicine system was implemented into the country. *Eurycoma longifolia* (tongkat ali), *Labisia pumila* (kacip fatimah), *Ficus deltoidea* (mas cotek) and *Cymbopogon nardus* (serai wangi) are the most common traditional Malaysian medicinal plants (Wiart, 2002; Wiart, 2006).

Currently, numerous researchers are currently striving to discover more plants which have medicinal qualities and have the capability to be marketed as herbal remedies. Annonaceae is one of the families of plants that are considered to have elevated therapeutic benefits due to its extensive used in various alternative medicines.

## 1.2 Annonaceae Family

The Annonaceae family, consisting of about 135 genera and over 2500 species, is the largest family in the order Magnoliales (Anary, Brandão, Déborah & Santos, 2016). The family has a source of edible fruit that can be considered to have an economic importance. Nielsen (1993) stated that the prickly soursop (*Annona muricata*), the sugar apple (*Annona squamosa*), cherimoya (*Annona cherimola*), and custard apple (*Annona reticulata*) are among the most important source of edible fruit which is broadly used in the production of pulp, juice and consumed in nature. Some species of the family have their own medicinal uses. For example, the seeds of *Annona dioica* are used to treat diarrhea while the leaves are used to treat rheumatism (Nielsen, 1993). From 135 genus in Annonaceae family, three genus were analysed which are

*Polyalthia*, *Goniothalamus*, and *Xylopia*.

### 1.2.1 The Genus *Polyalthia*

Based on the report by International Plant Names Index, with approximately 346 species recorded, the *Polyalthia* genus has become one of the largest genera in the Annonaceae family (IPNI, 2012). *Polyalthia* trees and shrubs are reported to occur primarily in tropical and subtropical regions, particularly in Southeast Asia, widening from Southern India and Sri Lanka through continental Southeast Asia to Northern Australia and Melanesia, with some occurrences occurring in the lowland wetlands of East Africa and Madagascar (Bakker, 2000). *Polyalthia* species have also been widely

used in numerous treatments in alternative medicine. Table 1.1 demonstrates the medicinal uses of several *Polyalthia* species.

Table 1.1

*Medicinal uses of several Polyalthia species*

| <b>Species</b>       | <b>Part</b> | <b>Medicinal Uses</b>  |
|----------------------|-------------|--|
| <i>P. beccarii</i>   | Leaf        | Used to treat skin diseases (Burkill & Haniff, 1930)   |
| <i>P. cerasoides</i> | Stem        | Used to treat postpartum recovery (Lamxay, de Boer & Björk, 2011)  |
|                      | Root        | Used as tonic and febrifuge (Treeratana et al., 2011)  |
| <i>P. debilis</i>    | Root        | Used to treat abdominal Pain (Kanokmedhakul, Kanokmedhakul, Yodbuddee & Phonkerd, 2003)                            |
| <i>P. evecta</i>     | Root        | Used for the treatment of galactagogue (Kanokmedhakul, Kanokmedhakul, Ohtani & Isobe, 1998)                        |
| <i>P. fragrans</i>   | Leaf        | Used as an ingredient for cough and anemia (Burkill, 1966)   |
| <i>P. hypoleuca</i>  | Root        | Used to cure postpartum depression (Burkill, 1966)   |
| <i>P. korinti</i>    | Root        | Used for the cure of stomachache and also as a good antidote for snake bite (Burkill, 1966)                        |
| <i>P. longifolia</i> | Stem        | Used to treat rheumatic fever, diarrhoea, indigestion, bark gonorrhoea, uterus aliment (Sinhbabu & Banerjee, 2013) |
|                      | Leaf        | Used to treat bone fracture and to treat postpartum depression (Suneetha, Prasanthi, Ramarao & Reddi, 2011)        |

*(to be continue)*

Table 1.1 (*continue*)

| Species              | Part | Medicinal Uses  |
|----------------------|------|---|
| <i>P. longifolia</i> | Stem | Used to treat skin diseases, diabetes, urinary tract infection and reducing blood pressure (Pallathupatti & Nadu, 2018) |
|                      | Root | Used to treat skin infections (Burkill, 1966)   |
| <i>P. oliveri</i>    | Leaf | Used as a cure for blackwater fever, to treat yellow fever. (Burkill & Haniff, 1930)                                    |
|                      | Bark | Used as a vermifuge (Burkill & Haniff, 1930)  |
| <i>P. rumphii</i>    | Root | Prevention of rheumatic fever, hypertension, and inhibition of cancer cells (Yuan et al., 2011)                         |
| <i>P. suberosa</i>   | Root | The decoction is used as abortifacient (Burkill, 1966)  |

*Polyalthia* has several general features. The flowers have six petals, the amount of sepals varying from three to six, and the amount of ovules per carpel may be one or three (Li & Gilbert, 2011). Few numbers of studies on the phytochemicals of *Polyalthia* species have been done and showed that the species are rich in alkaloids, tannins, saponins and glycosides (Lui, Jalil, Attiq, Chiew & Zakaria, 2018). Four species have been selected for this study which are *P. stenopetalla*, *P. sumatrana*, *P. cauliflora*, and *P. rumphii*. The descriptions for each species are shown in Table 1.2.

Table 1.2

*The selected species of the genus Polyalthia*

| Species                | Image   | Description   |
|------------------------|---|---|
| <i>P. stenopetalla</i> |    | <p><b>Local name:</b> <i>Jambul cicit</i></p> <p><b>Distribution:</b> Peninsular Malaysia, Borneo</p> <p><b>Medicinal uses:</b> Used to treat rheumatic fever and diarrhoea (Burkill &amp; Haniff, 1930; Burkill, 1966).</p>                          |
| <i>P. sumatrana</i>    |   | <p><b>Local name:</b> <i>Karai puteh</i></p> <p><b>Distribution:</b> Asian tropics, South-East Asia</p> <p><b>Medicinal uses:</b> Used to treat cough and anemia (Burkill &amp; Haniff, 1930; Burkill, 1966).</p>                                     |
| <i>P. cauliflora</i>   |  | <p><b>Local name:</b> <i>Lia padang, Semukau</i></p> <p><b>Distribution:</b> Thailand, Peninsular Malaysia, Sumatra and Borneo</p> <p><b>Medicinal uses:</b> Used for birth control and skin disease (Burkill &amp; Haniff, 1930; Burkill, 1966).</p> |
| <i>P. rumphii</i>      |  | <p><b>Local name:</b> <i>Merpadi</i> (Malaysia)</p> <p><b>Distribution:</b> Asian tropics</p> <p><b>Medicinal uses:</b> Used to treat skin disease (Burkill &amp; Haniff, 1930; Burkill, 1966).</p>   |

### 1.2.2 The Genus *Xylopia*

The second largest genus of the Annonaceae family is *Xylopia*, approximately 180 species worldwide. It has been found largely in West African countries such as Nigeria, Ghana, and Cameroon (David & Nancy, 2018). *Xylopia* are canopy trees with 50 m tall. The leaves are distichous, exstipulate, simple, entire and the leaf blades are commonly narrow oval shape, elliptic, or oblong, and papery to leathery. The flowers has a single spiral of three sepals, a spiral of three outer petals, and a spiral of three inner petals borne on a flat or slightly concave receptacle. The fruits usually follows Annonaceae summative pattern, with each carpel developing into a discrete fruitlet called a monocarp (Lamaty, Menut, Bessiere, Zollo & Fekam, 1989; Quintans, 2013; Da Silva et al., 2013; De Souza et al., 2015).

Phytochemical investigations of some *Xylopia* species have indicated the presence of alkaloids, flavonoids, terpenes as well as essential oils. These phytochemicals exhibited several biological activities, such as antifungal, antioxidant, cytotoxic, antinociceptive, and insecticidal (Da Silva et al., 2013). There are many reports of local used of *Xylopia* wood as a material for building and tools (Alojga, Chavez-Leon, Osei-Adjei & Onoja 2019). Table 1.3 shows several *Xylopia* species and their medicinal uses.

Three species from the genus *Xylopia* have been selected which are *X. magna*, *X. ferruginea*, and *X. frutescens*. The descriptions for each species are shown in Table 1.4.

Table 1.3

*Medicinal uses of several Xylopiya species*

| Species              | Part    | Medicinal Uses  |
|----------------------|---------|---|
| <i>X. aethiopica</i> | Fruit   | Used to treat syphilis, boils, malaria, fungal infections, cough, stomachache, hernia, cholera, dizziness, amenorrhea, headache, neuralgia, carminative, rheumatism, haemorrhoids, dysentery, flatulence, bronchitis, uterine fibroid and female infertility (Ghana Herbal Pharmacopoeia, 2007) |
|                      | Roots   | Orally administered to eliminate worms (Irvine, 1961)   |
|                      | Leaves  | Decoctions of the leaves are used against rheumatism, headaches and as an emetic (Yapi et al., 2012)  |
|                      | Seed    | Used to treat scabies, asthma, stomach pains, rheumatism, malaria, cough, bronchitis, dysentery, female sterility and abdominal pains (Kama Niamayou, Binaki, Enzonga Yoca, Loumouamou, Myoula Tsiéri & Silou, 2014)  |
| <i>X. aromatica</i>  | Flowers | Use in folk medicine as a stimulant, diuretic, and treatment of digestive diseases (Do Nascimento et al., 2018)   |
| <i>X. ferruginea</i> | Bark    | Used to stop vomiting (Flora Fauna Web, 2019)   |
| <i>X. frutescens</i> | Seeds   | Used to treat inflammation, antidiarrheal, and digestion (De Souza et al., 2015)  |

*(to be continue)*

Table 1.3 (continue)

| Species              | Part   | Medicinal Uses   |
|----------------------|--------|--|
| <i>X. laevigata</i>  | Leaves | To treat heart diseases, treating tumors and inflammatory conditions (Queiroz et al., 2014)                                    |
| <i>X. malayana</i>   | Leaves | Used for treatment after childbirth (Kamarudin, 1988)  |
| <i>X. parviflora</i> | Roots  | Used as chewing stick and anti-bacterial components which keep the teeth healthy (Babarinde, Pitan, Olatunde & Ajala, 2015)    |
| <i>X. sericea</i>    | Seeds  | Analgesic, anti-inflammatory and to treat gastrointestinal disorders (Mendes et al., 2017)                                     |
|                      | Fruits | Used as a carminative remedy, and are often used as a condiment in cuisine as a replacement for 'black pepper' (Lorenzi, 2002) |

### 1.2.3 The Genus *Goniothalamus*

*Goniothalamus* is a trees and shrubs, comprising about 160 species and mostly found occurring across Indochina and Malaysia in tropical Southeast Asia. Around 44 species of *Goniothalamus* have been identified and recorded in Malaysia. The botanical characteristics of *Goniothalamus* species are simple, strongly aromatic bark, having few leaves that are simple, alternate, and exstipulate. In addition, axillary and characteristically woody, fusiform and sometimes dark green are the flowers (Wiar, 2006).

Phytochemical studies of this species have led in the discovery of derivatives of styryl-lactone and also have been proved to produce embryotoxic properties (Sam, Chew, Sabirin, Gan, Dzulkifli & Mohamed, 1987). Previous studies have described the biological activities of various *Goniothalamus* species such as antibacterial, antimicrobial, antifungal, antioxidant, and cytotoxicity activities (Aslam, Ahmad,

Mamat, Ahmad & Salam, 2016). Table 1.5 shows several *Goniothalamus* species and their medicinal uses.

Table 1.5

*Medicinal uses of several Goniothalamus species*

| Species                  | Part      | Medicinal Uses   |
|--------------------------|-----------|--|
| <i>G. amuyon</i>         | Seed      | Used to treat scabies, rheumatism and tympanites (Ahmad, 1991)   |
|                          | Fruit     | Used to treat stomachache (Quisumbing, 1951)   |
| <i>G. dolichocharpus</i> | Root      | It is boiled and taken orally by the Kelabit community to ease stomachache (Quisumbing, 1951)  |
| <i>G. giganteus</i>      | Root      | Used in abortion and treatment of colds (Wuart, 2006)  |
|                          | Leaf      | Heated leaves are applied onto swellings (Wuart, 2006)   |
| <i>G. laoticus</i>       | Stem bark | Used traditionally as a tonic and a febrifuge by the local people (Wu, 1991)   |
| <i>G. macrophyllus</i>   | Leaf      | Used to allay fever (Alkofahi et al., 1988)  |
|                          | Root      | Used as a postpartum remedy and to cause abortion, antiaging purposes, rheumatism, skin complaints, and used to treat body pains (Alkofahi et al., 1988) |
| <i>G. malayanus</i>      | Root      | Treatment of rheumatism and fever (Ahmad, 1991)  |
|                          | Bark      | Treat measles and as insect repellents (Ahmad, 1991)   |
| <i>G. scortechinii</i>   | Leaf      | Used as a postpartum protective remedy and were used to improve blood circulation (Burkill, 1966)  |

(to be continue)

Table 1.5 (continue)

| Species             | Part  | Medicinal Uses  |
|---------------------|-------|---|
| <i>G. tapis</i>     | Root  | Used to treat typhoid fever (Inayat-Hussain, 1999)  |
| <i>G. uvaroides</i> | Roots | Used as postpartum protective remedies, abortifacients, typhoid fever, rheumatism (Moharam et al., 2012)  |
| <i>G. velutinus</i> | Leaf  | Used as a traditional medicine for treating headache, food poisoning, snake bite remedies, induce abortion and as a post-partum remedy (Inayat-Hussain, 1999) |

Meanwhile, two species from the genus of *Goniothalamus* have been selected which are *G. macrophyllus* and *G. malayanus*. The descriptions for each species are shown in Table 1.6.

Table 1.6

*The selected species of the genus Goniothalamus*

| Species                | Image   | Description   |
|------------------------|---|---|
| <i>G. macrophyllus</i> |  | <p><b>Local name:</b> <i>Gajah Beranak</i></p> <p><b>Distribution:</b> Peninsular Malaysia, Sumatra</p> <p><b>Medicinal uses:</b> Fever and for postpartum remedy (Burkill &amp; Haniff, 1930).</p> |
| <i>G. malayanus</i>    |  | <p><b>Local name:</b> <i>Kenanga Paya</i></p> <p><b>Distribution:</b> Peninsular Malaysia, Sumatra</p> <p><b>Medicinal uses:</b> Effective as a mosquito repellent (Burkill, 1966).</p>             |

### 1.3 Problem Statement

Due to their range of phytochemicals and biological properties that have been documented, medicinal plants from the Annonaceae family seem to be of considerable significance. However, several Malaysian species of Annonaceae have not been extensively studied, both chemically and biologically. Nine species from Annonaceae family have been selected for this study. Taking into account the importance of the medicinal uses of this genus in the treatment of several diseases, it is clear that there is a need to explore a wider range of studies. Consequently, studies have been investigated concerning the extraction of essential oils, the isolation of phytochemicals and the biological activity of the species selected. The research findings will make a positive contribution in the future to the enhancement of human wellbeing and also to the field of pharmaceutical products.

### 1.4 Objectives of Study

The objectives of the study are:

1. To investigate the chemical compositions of the essential oils from Annonaceae family
2. To isolate and characterize the phytochemicals from *Polyalthia rumphii* and identified spectroscopically.
3. To determine the cyclooxygenase-2 inhibitory activity of the essential oils and crude extracts.

## 1.5 Scopes of Study

The study was separated into three parts. The first part was on the extraction of the essential oils by hydrodistillation method from the leaves of *P. stenopetalla*, *P. sumatrana*, *P. cauliflora*, *P. rumphii*, *X. magna*, *X. ferruginea*, *X. frutescens*, *G. macrophyllus*, and *G. malayanus*. The chemical compositions of the essential oils were analysed using GC, GC-MS and Kovats Indices. The second part was to isolate the major phytochemicals from *P. rumphii* extracts using various chromatographic methods. The structures of the isolated phytochemicals were analysed spectroscopically using IR, UV, 1D and 2D NMR, and MS. Finally, the biological activity of the essential oils and crude extracts were carried out against cyclooxygenase-2 (COX-2) inhibitory activity.
